

Animal Inquiry: Sea Otters

By:Omar

1) What the animal looks like:

Two layers of fur one short & one long, webbed feet, flat tail, and whiskers.
Sea otters are about the size of a medium size dog.

2) How the animal moves:

Webbed feet help it swim fast.

3) How the animal eats:

Whiskers help them feel for food in dark water.
They eat sea urchins, snails, fish, and crabs.
Sea otters use rocks to open food.
Sea otters float on their back while they eat.

4) Where the animal lives:

The sea otter lives in the Pacific Ocean.

5) How the animal adapts to its environment:

Sea otters wrap kelp around their body to prevent them from floating out into the ocean.

6) Detailed description of the habitat:

Sea otters live near kelp beds.

7) How the animal is born:

The baby sea otter is born in the ocean.
The mother gives birth to one pup at a time.

8) What the babies look like:

9) How the babies change as they grow:

A pup stops drinking its mother's milk at four to six months of age.
When the pup is 14 weeks old it can dive and swim.
When the pup is 6 to 12 months old it will leave its mother
and will look for food on its own.

10) The animal's enemies:

Sharks and whales are sea otter enemies.

11) How the animal protects itself:

Sea otters kill other animals that kill kelp.

12) How the animal communicates:**13) Interesting Facts:**

Sea otters are warm-blooded mammals.

The sea otter's fur helps to keep them warm in cold water.

Sea otters float in groups known as rafts.

The sea otter pup rests on the mother's belly in the water.

Male sea otter are known as
